

Undirected Graphs: Isomorphism

Types of Graphs

Directed Graphs

Undirected Graphs
(Simple)

Multi-Graphs

Definition

An **Undirected Graph** is a set of **vertices** V and a set of **edges** E where each edge is an unordered pair of distinct vertices a and b .

$$a-b \text{ (edge } ab) = \{a, b\}$$

Degree of a vertex v is the number of edges it connects to.

$$\text{deg}(a) = 2$$

$$\text{deg}(b) = 4$$

Connections not layout

Isomorphic Graphs

“same” graph, different labels

Graph Isomorphism

Graphs G_1 and G_2 are **isomorphic** if there exists a **bijection** $f: V_1 \rightarrow V_2$ such that for all u, v in V_1

$$u-v \text{ is in } E_1 \text{ iff } f(u)-f(v) \text{ is in } E_2$$

There is a one-to-one correspondence between the nodes of G_1 and G_2 that preserves all edge connections.

Are these Isomorphic?

Find a Mapping

Function
 $f(\text{Dog}) = \text{beef}$
 $f(\text{Cat}) = \text{tuna}$
 $f(\text{Cow}) = \text{hay}$
 $f(\text{Pig}) = \text{corn}$

lec 4F.8

Finding the Mapping

- Not easy, can try all possible mappings
 - Roughly $n!$ possibilities
- Can test for Invariants
 - Same number of nodes, edges
 - Same degree distributions
 - Preserves cycles, longest path, etc
